                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEC files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
     Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analysis, gene expression, reverse transcription, primer, cDNA, aggregate, restriction enzyme, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ7547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of CDNAs, in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                            Gaps

         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of CDNAs, in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                  Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reverse transcription primer used in cDNA analysis technique.

                                                                                                                               alysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESGA files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                     cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

A method for the analysis of cDNA comprises (a) preparing an aggregate of
                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene expression; reverse transcription; primer; cDNA; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reverse transcription primer used in cDNA analysis technique

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESSO files AA075547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis; gene expression; reverse transcription; primer; cDNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Сарв

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anchor region. The complement of which is present at last once in each nucleic acid and a 3 · variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture computes a sequence of 10-50, particularly 15-55, T residues. The capture of agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-55, T residues. The capture of 10-50, particularly 15-55, T residues. The capture of 10-50, particularly 15-55, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resih, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is spaticularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, or supplements, especially minerals, capture layers of differences in pools of their derivatives, rander of activity of the complete pattern of all mucleic acids from a cell, and can detect very small differences in the nucleic acid solid in a cell, and genes, matrix miniaturisation is based on compatison of nucleic acid pools. Since the capture probes used in the

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agants that are (a) immobilised on the surface of a solid matrix and (b) comprise variable anchor region. The complement of which is present at least once in each nucleic acid and a 3-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sortes of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, computing properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is stranded nucleic acids to the surface is (quasi)covalent, supramolecular strended nucleic acids to the surface is (quasi)covalent, supramolecular is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular is phe method is used (1) for analysis of patterns, especially in mucosal, acids (amino, carboxylic or fatty acid) or through a molecular sieve. The method provides rapid, inexpensive and reproducible captes acids (amino, carboxylic or fatty acid) or their derivatives, or gam call, and can detect very small differences in pools of nucleic acid becomparious of can detect very small differences in the nucleic acid pools, not individual genes, matrix miniaturisation is possible. Ankol281-ADK01344 represent expensed in the method of the invention.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable and non-variable regions. The capture oligonucleotides comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface interaction with streptavidin. The matrix is of plastic, ceramic, glass, interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially, in mucosal, thair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxyllic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible can detect very small differences in pools of nucleic acid in a cell, and can lower in page of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid coid or acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids acids by bound using capture cagents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow binding of particulars sorts of single stranded nucleic acids. The capture organizes are particularly locked nucleic acids (LMA) and the anchor region comprises are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, ceranded nucleic acids to the surface is (LMA) and baving semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (b)0)molecular filaments and binding of sangle cranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, surfaced by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially, in mucosal, caids (amino, carboxylic or fatty acid) or their derivatives, salts and activity of pharmaceuticals and/or nutritional compounds, e.g. food acids in an ender and on nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible callows inaging of the complete pattern of all nucleic acid sold in the nucleic acid pool; since the method is based on comparison of nucleic acid pool; since the carrive very small differences in the nucleic acid pool; since the carrive very small differences in the nucleic acid pool; the inventor of the inventor of the inventor of the capture probes used in the method of the invention.

single-stranded nucleic acid, useful for analyzing expression and screening active agents, uses capture agent with variable patterns and screenin and constant regions.

German. Example; Page 5; 8pp; Example; Page 5; 8pp; German.

Comprise Variable anonov region, the capture oligomuciocides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region. That comprises all possible combinations of up to 10 nucleotides to allow binding of particulary sorts of single stranded nucleic acids. The capture of particulary locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface is particularly a layer of (blo)molecular filaments and binding of single conducting stranded nucleic acids to the surface is (quas) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cativity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible captor allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual capture probes used in the method of the invention. This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture cagents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at case in once in each nucleic acid and a 1'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particulars sorts of single stranded nucleic acids. The capture of agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quared nucleic acids to the surface is quasa) covalent, sprond network or garm cells and (ii) for analysis of patterns, especially in mucosal, additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and acids (amino, carboxylic or fatty acid) or their derivatives, salts and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root; blood; nerve; germ cell; food additive; food supplement.
method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                            Gaps

and
mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) there the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) there are in an non-variable regions. The capture oligonucleotides are particular sorts of single stranded nucleic acids. The capture binding of particularly locked nucleic acids (LNA) and the anothor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (LNA) and the anothor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quash) capture, supramolecular, physical, stimulated by an electrical field or through a molecular, The method is used (i) for analysis of patterns, especially in mucosal,

```
hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cells, and detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises: (a) cDNAs obtained by transcribing respectively from at least two tissue RNAs are respectively from at least two tissue RNAs are respectively from at least two tissue RNAs are respectively fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from adad cDNAs are mixed together; (d) an adaptor primer having the common sequence to said different adaptor and a gene specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from polyadenylic acid of the mRNA before the addition of the adaptor among the measured between the tissues; (f) the RNA is detected from the measured result; (g) each different adaptor and a common adaptor of the adaptor acid of the genomic DNA fragments derived from a same or different individuals; (h) the resultant adaptor-added genomic DNAs are mixed together; (i) the daptor-added genomic DNAs are applified by using an adaptor primer having the common sequence to the different adaptor and adaptor and adaptor and deprecent of the amounts of the amplified amounts of the genomic DNAs are measured between the individuals. The method is cused for the detection of the amounts of RNA and DNA. The present core exemplification of the present invention Comparative detection of the amounts of RNA and DNA. Solid phase immunoassay using oligo:nucleotide as label - also new conjugates of oligo:nucleotide coupled to antigenic peptide, partic. for

diagnosing hepatitis C or E virus infection.

```
AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject. The method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any unreacted L, and then detecting the presence of the oligo. A similar method can be used to detect Abs, in which case the ligand is an oligo-labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab to be detected at very low levels. An exemplary olgi is AAQ75024 which can be covalently attached by the 5' terminus to the N- or C-terminal of a synthetic peptide. For LCR using oligo AAZ75024, oligos 1-4 (see
                                                             AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleotide sequences encoding spearmint (-)-limonene-6-hydroxylase (L6H) and peppermint (-)-limonene-3-hydroxylase (L13H). Host cells containing a vector comprising the nucleotide sequences can be used for the recombinant production of limonen hydroxylases or of primary enzyme products are trans-carveol in the case of (-)-L6H or trans-isopiperitenol in the case of (-)-L3H, which are of subsequent use, to obtain enhanced expression of limonene hydroxylase in plants to attain enhanced trans-carveol or trans-isopiperitenol production as a predator or pathogen defense mechanism, attractant or environmental signal. The limonene hydroxylase genes and for examining the developmental regulation of monoterpene hydroxylase genes and for examining the developmental regulation of monoterpene horse maplification of (-)-limonene-6-hydroxylase cDNA
                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated limonene hydroxylase nucleic acids - which encode limonene-6-hydroxylase and limonene-3-hydroxylase, which can be used to produce trans-carveol and trans-isopiperitenol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The present primer was used to reverse transcribe cDNA encoding a C-20 oxidase. The amplifie fragment is used in the method of the invention. The specification describes methods for the inhibition and control of gibberellic acid levels. Gibberellic acid levels may be inhibited or controlled by use of a chimeric expression construct expressing a RNA protein which suppresses the gibberellin biosynthetic pathway sequence, diverts substrate from the pathway, or degrades pathway substrates or products. The methods uses copalyl diphosphate synthase, is beta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a lateral phytosne synthase, c-20 oxidase, and a lateral phytosne synthase, c-20 oxidase, and a lateral phytosne synthase, c-20 oxidase, and can seed germination and seedling growth especially to regulate gene products of gibberellin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The plants products are gibberellin deficient, and have shortened hypocotyl and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Obtaining transgenic plant useful for controlling seed germination and seedling growth comprises transgene comprising a sequence expressing altered levels of an essential hormone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kishore GM, Logusch EW, Logusch SJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gibberellic acid, copalyl diphosphate synthase, 3beta-hydroxylase, 2-oxidase; phytoene synthase, C-20 oxidase, 2beta,3beta-hydroxylase, seed germination; seedling growth; gibberellin biosynthetic pathway; transgenic plant; hypocotyl; epicotyl; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Primer HOOK for cDNA encoding a C-20 oxidase polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 0 U; 1 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   epicotyl phenotypes compared to normal plants

```
fatty lesion development, which comprises any of 55 polynucleotide sequences from Oryctolagus cuniculus. The polynucleotide, polypeptide or antibody is useful for preventing, treating, modulating or ameliorating a medical condition, particularly atherosclerosis. The invention is used as marker or detector of nervous system disorder or disease (e.g. parkinson's disease, Alzheimer's disease, ischaemia, dementia). The invention may also be useful for treating deficiencies or disorders of the immune system (e.g. lymphopaenia, leukocyte adhesion deficiency syndrome or haemoglobinuria, anaemia), hyperproliferative disorders (e.g. Gaucher's disease), infectious disease (e.g. herpes simplex), coagulation disorders, blood platelet disorders and autoimmune disorders (Addison's disease, rheumatoid arthritis, dermatiis, Grave's disease). The polynucleotide sequence is a lso used in gene therapy. The present sequence is a 3' sequencing primer used in the identification and characterisation of polynucleotides up-regulated by fatty lesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an isolated nucleic acid regulated by

The present invention describes isolated neuroleptic-regulated nucleic acid molecules. (I) have neuroleptic, antimanic and antidepressant acid molecules. (I) have neuroleptic, antimanic and antidepressant activities, and can be used in gene therapy. (I), polypeptides (II) encoded by (I), or a host cell (III) comprising (I), are useful for preventing, treating, modulating or ameliorating a medical condition such as a neuropsychiatric disorder. (I) are useful as diagnostic agents for diagnostic a pathological condition such as neuropsychiatric disorder e.g. schizophrenia, a bipolar condition such as neuropsychiatric disorder e.g. schizophrenia, a bipolar disorder or addiction-related behaviour. (I) are useful for detecting the control gene expression through triple helix formation ample. (I) can be used as probes and primers, for chromosome control gene expression through triple helix formation identification, to control gene expression through triple helix formation control gene expression through triple helix formation disorders, identifying individuals from minute biological samples, as an alternative to restriction fragment length polymorphism (RFLP) and as polymorphic markers for forensic purposes. (I) is also useful as molecular weight markers on Southern gels, diagnostic probes for the presence of specific mRNA in a particular cell type, as a probe to subtract-out known sequences in the process of discovering novel controlledides, for selecting and making oligomers for attachment to a gene chip or other support, to raise anti-DNA antibodies using DNA immunisation technique, and as an antigen to elicit an immune response. The areas an antigen to elicit an immune response. The areas an antigen to elicit an immune sequences used in the areas and antigen to elicit an immune sequence. The present sequence represents a primer used to isolate novel mouse microglia and macrophage regulatory gene DST (digital sequence tag) sequences. A806401-A806590 represent these novel sequences and the sequences used to isolate them. The PCR-based total gene expression analysis (TOGA) system is used to examine the expression pattern of molecules corresponding to genes that are regulated in cartivated microglia, activated microglia, unstimulated macrophage and activated macrophage. The polymolecities of the invention, the polympetides encoded by them and antibodies that bind to these polympetides are useful are useful for the diagnosis, prevention, treatment or amelioration of a medical condition, preferably a neuroinflammatory pathology or a neurodegenerative disease such as Alzeimer's disease, senile dementia, Parkinson's disease, obsessive compulsive disorders, epilepsy, schizophrenia, multiple sclerosis, depression and bipolar manic-depressive disorders (e.g. severe combined immunodeficiency, SCID) cancer), immune disorders (e.g. severe combined immunodeficiency, SCID) cancer), immune disorders (e.g. insulin dependent diabetes mellitus).
                                                                                                                                                                      New regulated genes of microglia and macrophages, useful for diagnosing, preventing or treating neuroinflammatory pathology and neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Central nervous system; CNS; neuroleptic; mouse; human; psychoses; neuropsychiatric disorder; psychiatric disorder; Alzheimer's disease; Pick's disease; Binswanger's disease; sencephalopathy; Parkinson's disease; obsessive compulsive disorder; epilepsy; ischaemia; addiction; multiple sclerosis; depression; manic-depressive disorder;

This invention relates to the CDNA sequences of novel isolated polynucleotides associated with psychoses or other neuropsychiatric consistences of the invention may act as blockers of D. 2 receptors in the meso-limbic dopamine system. The nucleotide sequences of the invention and the polypeptides encoded by them are useful in the meso-limbic anedical condition e.g. a neuropsychiatric disorder. An antibody that binds the proteins of the invention is useful for antibody that binds the proteins of the invention is useful for preventing, treating, modulating or ameliorating neurological disorders or antibody that binds the proteins of the invention is useful for such as psychoses or other neuropsychiatric disorders or a susceptibility to a neurological disorder such as psychoses or other neuropsychiatric disorders or a susceptibility to a neurological disorder such as psychoses or other neurological disorders and other containing the alteration (increase or decrease) in the expression of determining the alteration (increase or decrease) in the expression of deficiencies or disorders of the invention are useful in treating deficiencies or disorders of the central nervous system or peripheral correction or mobilisation (chemotaxis) of neuroblasts, stem cells or glial cells The sequences are useful as a marker or detector of a corricular nervous system fisease or disorder such as Alzheimer's disease, pick's disease, Binswanger's disease, other senile dementia, particular nervous system compulsive disorders, epilepsy, encephalopathy, ischaemia, addiction, multiple sclerosis, depression and manic-depressive disorder. The present sequences are setulation of the containing the province of a collgonucleotide primer used in the identification of the containing the colls of the containing the province or disconders and collgonucleotide primer used in the invention of the containing the collsonal and the containing the province or disconders.
                                                                                                                                                                                                                   New polynucleotide useful in gene therapy for preventing, treating modulating or ameliorating a medical condition such as psychoses or a neuro psychiatric disorder e.g. schizophrenia, or a bipolar disorder in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rabbit; Oryctolagus cuniculus; atherosclerosis; intimal hyperplasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes an isolated polymucleotide (I) and its complements, and degenerate variants, comprising a sequence selected from complements, and degenerate variants, comprising a sequence selected from those given in ABO73226 to ABO73222 (NS), which is a digital sequence tag (DST) corresponding to mRNAs whose expression is regulated by proliferative lesion development caused by mechanically induced intimal proliferative lesion development creatment, or by proliferative lesions and reversed by lercanidipine treatment, or by proliferative lesions can deversed by lercanidipine treatment. (I) has antiatherosclerotic activity and can be used in gene therapy. (I) can be used for diagnosing cativity and can be used in gene therapy. (I) can be used for diagnosing the medical condition hased on the presence or absence of the mutation. (I) is also useful for diagnosing atherosclerosis, or the susceptibility continuous conditions and also condition such as antherosclerosis in amount of expression of (I). (I) is also used for preventing, treating, modulating, or ameliorating a medical condition such as atherosclerosis in amammalian subject. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    modulating

The present invention relates to a method for preventing, treating, modulating or ameliorating a medical condition. The method involves modulating one or more nucleic acid molecules up- or down-regulated in hepatitis B virus (HBV) infection or polypeptides encoded by the nucleic acid molecules or antibodies that bind to the polypeptide. The method is useful for preventing, treating, modulating or ameliorating a medical condition. It is also useful for determining the presence or absence of a mutation in the nucleic acid molecules or detecting an alteration in expression of the polypeptide which is useful for the diagnosis of the patitis viral infection (e.g., acute hepatitis versus chronic hepatitis viral infection and a gene expression publication and a gene expression profile is useful for identifying polypeptides and polynucleotides which are associated with charaptitis viral infection. Sequences of the invention are used in gene therapy, and as vaccines. Nucleic and sequences are useful as a

Preventing and treating hepatitis viral infection in a mammal, comprises administering nucleic acid molecules that up- or down-regulate in hepatitis B virus infection or polypeptides encoded by the nucleic acid

```
The invention relates to control of gibberellin (GA) levels in plants.

The method involves producing transgenic plants having a phenotype of reduced seed germination and reduced early seedling growth, then restoring seed germination and early seedling growth by treating plants with an appropriate compound when conditions are favourable. The method is useful to control seed germination and/or early seedling growth in ggricultural production so that unfavorable environmental conditions normally reducing agronomic output can be avoided and yields increased. Plants also demonstrate increased uniformity of germination, emergence and seedling vigor, so increasing yields at harvest. The method is especially useful in crop plants such as e.g. canola, soybean, cotton, cotto, and is also useful in storage and transport of seeds to reduce premature germination which may affect agronomic or food quality of the seeds. The present sequence is a PCR primer used to isolate pumpkin 2beta in the exemplification of

polypeptides. The chimeric polypeptides comprise a polypeptide segment that exhibits histone acceyltransferase activity, and a polypeptide segment that exhibits histone acceyltransferase activity, and a polypeptide segment having 40% or greater sequence identity to a subunit of a histone deacetylase chromatin-associated protein complex. The chimeric polypeptides are useful for determining gene expression profiles in specific cells, for modulating gene expression in specific cells, and for making genetically modified enkaryotes. The present sequence represents a reverse transcription primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pathological condition (comprises administering to a mammalian subject at least one of: (a) a first polynucleotide comprising a sequence having at least one of: (a) a first polynucleotide comprising a sequence having 38-889 bp (consisting of the sequences in ACC79319 to ACC7932 (I)) or a second polynucleotide at least 95* identical to the first polynucleotide; (b) a third polynucleotide comprising at least 10-bp sequence that is hybridisable to the first polynucleotide under stringent conditions; or (c) a gene corresponding to any of (1)-(2) or another gene at least 95* identical to the gene. (I) have cytostatic activities, and can be used in vaccines and in gene therapy. The method is useful for preventing or treating e.g., ataxia telanglectasia (AT), AT tumours or other cancers. ACC79393 to ACC793423 represent primers used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preventing or treating a pathological condition e.g., ataxia telangiectasia (AT), AT tumors or other cancers comprises administering polynucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for preventing or treating a

Polynucleotides of the invention are useful for delivery of genes, DNA vaccines, diagnostic reagents, peptides, proteins or macromolecules. Sequences of the invention are useful for treating conservations of the invention are useful for treating conservations. Sequences of the invention are useful for treating constructs, equippesy, immune disorders (e.g., autoimmune disorders such as rheumatoid arthritis, Addison's disease, haemolytic anaemia, graft-versus-host disease, inflammation), hyperproliferative conservation, they are used for regeneration of disorders (e.g., neoplasms) and infectious diseases (e.g., viral, conservation, traplace or protect damage tissues, for increasing confiferantiation or proliferation of embryonic stem cells from a lineage, for modulating mammalian characteristics, (such as body weight or conservation of embryonic actabolism, processing utilisation and storage of energy, to change a mammal's mental or physical state, or as a food additive or preservative. The invention is useful in gene therapy. The present sequence is a ground primer used in the invention
                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Atherosclerosis, vaccine, nervous system disorder, Alzheimer's disease, Parkinson's disease, multiple sclerosis, immune disorder; gene therapy, autoimmune disorder; rheumatoid arthritis, hyperproliferative disorder; haemolytic namemia; graft-versus-host disease; inflammation; infection; epilepsy; Addison's disease, neoplasm; tissue regeneration; chemotaxis; food additive; food preservative; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a novel simplified TOGA (RTM) method for simultaneous sequence-specific identification of multiple mRNA molecules in a RNA population. The method involves characterising each of the sequence-specific polymerase chain reaction (PCR) products by partial sequence and length. The method is useful for determining tissue-specific patterns of gene expression or mechanisms of furg interaction. It is also useful for drug screening, studying physiological processes, genomic mapping or manufacture of diagnostic, prognostic or therapeutic reagents. The present sequence is a primer used to illustrate the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel tumor-associated oligopeptide that is recognized as an antigen by CD8+ cytotoxic T lymphocytes (CTL) and causes CTL-induced lysis and/Or apoptosis of tumor cells, especially multiple myeloma cells. The oligopeptide is derived from human PRDI-BFI (Dositive regulatory domain I-binding factor-1) which is able to induce an MHC (major histocompatibility complex) class I allels variant A2-restricted immune response of CD8+ CTL against tumor cells. The products of the invention have cytostatic activity and can be used in a vaccine. The convention have cytostatic activity and can be used in a vaccine. The proping of the invention, also related retro-inverse and pseudopeptides, clusion proteins (FP), polymucleotides, vectors, host cells and antibodies and T cell receptors specific for PRDI-BFI peptides are useful for creating diseases associated with PRDI-BFI, particularly tumors. The products of the invention are also useful as diagnostic, therapeutic and corphylactic agents for detecting, modifying, generating, expanding activation and functional status of T cells, and for prophylactic agents for mono-clonal or recombinant A2-restricted T cell receptors and their functional equivalents. This sequence represents and for the products of poly- or mono-clonal or recombinant A2-restricted in the functional equivalents. This sequence represents and functional equivalents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                      This invention relates to a novel method for preparing a library of same-length signature sequences from a source nucleic acid population. Specifically, it comprises producing solid phase cloned libraries of oligonucleotide tag-DNA signature sequence constructs, which are useful for sequencing many polynucleotides simultaneously. The present invention constructs using first, and 'second' adapter-signature-adapter constructs using first, and 'second' adapters each containing a specific restriction endomuclease recognition site, and which flanks the same length signature sequence. As such, using the method described herein it is possible to do parallel sequencing of large populations of polynucleotides for genomic mapping, genetic identification and medical diagnostics. This oligonucleotide sequence is a DNA oligo involved in the step wase process of preparing a library of same length signature sequences from restriction fragments in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infestinal epithelium cell development; peyer's patch M cell development; inflammatory bowel disease; glutenenteropathy; infectious disease; autoimmune disease; haemolytic anaemia; rheumatoid arthritis; dermatitis; Grave's disease; multiple sclerosis; allergy; asthma; diabetic mellitus; immune system disorder; hypersensitivity; anaphylaxis;

                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                       The invention comprises DNA sequences which are associated with intestinal epithelium and peyer's patch M cells. The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious disease, autoimmume diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's diseases or discretes of the immumen system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents a primer that was used in the exemplification of the
                                                                                                                                                                              Novel isolated or purified polypeptide encoded by genes associated with intestinal epithelium or M cell development, differentiation or function, useful for treating autoimmune diseases and infectious diseases.

```
The invention comprises the amino acid and coding sequences of lethal or non-viable proteins. The DNA and protein sequences of the invention are useful for transforming a plant cell, and producing transgenic plants that produce seeds that are not viable, not fertile, not capable of germinating, or are otherwise not capable of graminating, or are otherwise not capable of growing into mature plants. The present DNA sequence represents an oligo(dT)18 primer that was used
                                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated nucleic acid molecule from Arabidopsis, Maize, or Brassica and encoding an amino acid sequence exhibiting at least 8% sequence identity to SEQ ID NO. 3, 5, 7, 10, 12, 14, 17, 19, 21, 24, 26, 28, 31, 34, 36, 38, 41, 43, 45, 48, or 49 as given in the specification. The nucleic acids and polypeptides of the invention may act as plant growth regulators and as such may be useful for generating transgenic plants having increased size, increased number and size of tosette leaves and are late-flowering. The current sequence is that of the RT-PCR primer of the invention which was used to amplify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polypeptide having characteristic of being lethal or non-viability polypeptide, useful for producing transgenic plants that produce seeds that are not viable, not fertile, and are not capable of germinating.
                                                                                                                       Brassica, useful for generating transgenic plants having increased size, increased number and size of rosette leaves and are late-flowering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Non-viable seed-producing transgenic plant-related-oligo(dT)18 primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a nucleic acid molecule or its complement sequence capable of modulating transcription. The nucleic acid molecule of the invention is useful for transcription of polynucleotides in a host cell or transformed host organism. The present sequence is a primer used for modulating gene transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid molecule capable of modulating transcription, or its complement, useful for transcription of polynucleotides in a host cell or transformed host organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer d(T)18, SEQ ID NO: 73, used to generate probes for hybridization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transgenic plant; plant growth regulation; development; food,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AEC21692) which are capable of modulating transcription. The sequences are useful as promoter sequences or promoter control element sequences for modulating transcription, e.g. constitutive transcription, stress induced transcription, light induced transcription, dark induced transcription, leaf transcription, root transcription, silique transcription, callus transcription, flower transcription, immature bud and inflorescence specific transcription, or senescing induced transcription. The present sequence is a primer used for generating probes for the promoter sequences of the invention.

The invention relates to an isolated nucleic acid molecule capable of modulating transcription, where the nucleic acid molecule shows at least modulating transcription, where the promoter sequences given in the specification or its complement. The invention also relates to a vector construct comprising a first nucleic acid capable of modulating transcription, where the nucleic acid molecule shows at least 80% transcription, and a second nucleic acid molecule shows at least 80% sequence identity to one of the promoter sequences given in the specification, and a second nucleic acid molecules are heterologous to each the first and second nucleic acid molecules are heterologous to each contract and are operably linked together, a host cell comprising the other and are operably linked together, a host cell comprising the comprising the vector construct. The first conception and a plant comprising the vector construct. The first conception and a plant comprising the vector construct. The first conception and a given in the specification, where the first nucleic acid molecule is inserted into a plant cell and the plant cell is regenerated concerned and promoter control elements are useful for modulating transcription of a desired polynucleotide in plants. This sequence represents a synthetic continer used in the scope of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated promoter sequences and promoter control elements, useful for modulating transcription of a desired polynucleotide in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                  The present invention relates to polynucleotides and their encoding polypeptides with the use of those products for making transgenic plants. The sequences of the invention are useful modifying plant characteristics or for modulating and manipulating growth, development and biochemistry of a plant. The invention is useful for producing plants with increased yield of biomass or chemical components, in particular food and reproducible raw materials. The present sequence is a d(T)18 primer used to generate probes for hybridization. This sequence is used in making

Query Match 0.7%; Score 18.2; DB 1; Length 20; Best Local Similarity 94.7%; Pred. No. 8.9e+02; Matches 18; Conservative 1; Mismatches 0; Indels ö comprising a plant promoter sequence. (I) is useful for producing a transformed plant having shade responsive characteristics different from those of a naturally occurring plant of the same species cultivated under the same conditions, which involves introducing (I) into a plant or plant cell to modulate transcription in a plant. (I) is useful for expressing a developmental DNA sequence in a plant. (I) is useful for understanding developmental mechanisms e.g. shade responsive promoters that are induced during callus formation and somatic embryo formation, and for isolating trans-acting factors. (I) is also useful for modulating transcription in modulating genes involved in defense, pest resistance, herbicide resistance etc. The present sequence represents a plant promoter associated primer. The present invention relates to isolated nucleic acid molecules from Arabidopsis thaliana and the polypeptides encoded by them. The patentees also claim a vector construct containing such nucleic acid molecules, and a host cell transformed; a method for detecting a nucleic acid in a sample; and a plant, plant cell, plant material or seed of a plant which comprises the nucleic acid molecule which is exogenous or heterologous to the plant or plant cell. The vector construct comprises a first nucleic acid having a regulatory sequence capable of causing transcription and/or translation in a plant and a second nucleic acid having the sequence of the isolated nucleic acid molecule. The first and second nucleic acids are operably linked and where the second nucleic acid is heterologous to any element in the vector construct. The isolated nucleic acid molecules are useful in producing transgenic plants for use as models for modifying New nucleic acid molecule, useful in producing transgenic plants for use as models for modifying plant characteristics e.g. increase in plant height, number or size of leaves, or wood products. ```
This invention descibes a novel method for the analysis of a DNA fragment which comprises: (i) addition of a known common oligonucleotide sequence to at least one terminal of each DNA fragment, (ii) amplification of the resultant DNA fragment as a primer using a first common primer containing a complementary nucleotide sequence to the above mentioned known common of oligonucleotide sequence to the prepared known common componed to the sequence optionally having been introduced with complementary nucleotide sequence at a terminal, and a specific primer companies of the prepared known common oligonucleotide sequence to the prepared known common componed to the properties of the properties of the amplified DNA to find the information of the DNA fragment, in which the specific primer is designed to prepare fragments of the common first and second primers and to give short fragment of amplified DNA and (iv) contrament to make their differentiation. Of the DNA fragment of amplified DNA and of the common first and second primers and to give short fragment of amplified DNA and (iv) confirmations of known and unknown genes readily provides information of unknown genes and simultaneous monitoring of signals derived from minor confirmation of the properties of known and unknown according to functions of known and unknown according to functions of known and confirmation of signals derived from minor confirmation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Analysis of DNA fragment - comprises addition of known common oligonucleotide, amplification of resultant DNA fragment and analysis and labelling of amplified DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    genes can be performed. AA209189-Z09201 represent oligonucleotide primers
plant characteristics, e.g. increase in plant height, number or size of leaves, or wood products. The present sequence is that of a primer used in generation of labeled probes from first-stand cDNA.
                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is that of a bovine microsatellite sequence obtd. by

consecuing a library of bovine Mbol DNA fragments of between 250 and 500

consecuent an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50

clones cross-hybridised. Assuming independent distribution of

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

consecuent and proper second of the frequency of (T6)n >9 microsatellites

consecuent and indexed herein (see below). The sequence information

for ca. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

comparream of the microsatellite sequence were used to generate the

required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

consecuently important trait loci, or genes involved the determinism of

economically important traits esp. in cattle, to allow selective

breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides.

CT They are used in a method for detecting an antigen in a subject. The method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any curreacted L, and then detecting the presence of the oligo. A similar curreacted L, and then detecting the presence of the oligo. A similar captured and by the see the ligand is an oligo. The use of an amplifiable oligo as the label allows Ag or be labelled Ag. The use of an amplifiable oligo as the label allows Ag or to be detected at very low levels. An exemplary olgi is AAQ75024 which can be covalently attached by the 5· termina to the N· or C·terminal of can synthetic peptide. In the example, peptide AR62941 was coupled to oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to contain HBV Abs were immobilised on plastic tubes or wells, then contain HBV Abs were immobilised on plastic tubes or wells, then captide-oligo product. The vessels were separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR. The amplification product - AAQ75031 - was treated with uracil DNA cycles of product captured by immoblised oligo-dT. (Updated on 25-MAR-2003 to correct PN field.)

The treatment of animals, including humans, having a bacterial infection.

The treatment comprises administration of such nuclease resistant
oligonucleotides, targeted to a nucleic acid or protein of the bacterium,
and formulated with a carrier. A compound comprising this nuclease
resistant oligonucleotide can be covalently linked to an antibiotic. The
resistant oligonucleotide can be covalently linked to an antibiotic. The
method is used to treat infections by a wide variety of Gram-positive and
Gram-negative, or acid-fast, bacteria, in human and veterinary medicine.
The methods are particularly used in immuno-compromised individuals (e.g.
The methods are particularly used in immuno-compromised individuals (e.g.
The methods are particularly used in immuno-compromised individuals (e.g.
The methods are particularly used in immuno-compromised individuals (e.g.
The methods are particularly used in immuno-compromised individuals (e.g.
The methods are squired immunofeficiency syndrome or those receiving
Chemotherapy or radiation therapy), optionally in combination with, or
fused to, antiviral or other antimicrobial oligonucleotides. Apart from
Chaboratory cultures, foods, beverages and industrial processes. The
oligonucleotides are specific for bacteria, without affecting metabolism
on mammalian cells. They may also activate Rhase H and have a general,
non-specific immune-stimulating effect. The oligonucleotides can be
administered orally, intranasally, rectally, topically or by injection,
optionally coupled to an agent (e.g. carbohydrate or polyamine) that ö This antisense oligonucleotide is nuclease resistant and can be used in the treatment of animals, including humans, having a bacterial infection oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics. A method has been developed for labelling an oligonucleotide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated Gaps Primer; oligonucleotide; labelling; detection; self-priming; PCR; ss. ö Labelling of an oligonucleotide - useful for detecting genes. 0.7%; Score 18; DB 1; Length 18; 100.0%; Pred. The invention relates to a new composition for selective, sequence-
ce specific inhibition of gene transcription and expression in a host. The
composition comprises oligonucleotides containing arabinose sugars that
can hybridise to either a a single-stranded (ss) RNA to induce RNase H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
ce lelix, thereby inhibiting DNA replication and/or transcription. The
coligoarabinonucleotides are used for antisense inhibition of gene
cypression or to prevent DNA replication, or reverse transcription of
control prevent DNA replication, or reverse transcription of
control in combination with RNase H, as reagents for sequence-specific
cinhibit retrovirus replication. The oligoarabinonucleotides can also be
consequent to make mapping, and additionally for the study and control of
central genomic RNA, increased resistance to nucleases and show little if
affinity for RNA, increased resistance to nucleases and show little if
cany non-specific binding to cellular or serum proteins They target as

The invention relates to a new composition for selective, sequence-
specific inhibition of gene transcription and expression in a host. The
composition comprises oligonucleotides containing arabinose sugars that
can hybridise to either a a single-stranded (ss) RNA to induce RNase H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage or the oreompositions are therefore particularly used to
clinhibit retroviral replication. The oligoarabinonucleotides can also be
cleavage or RNA mapping, and additionally for the study and control of
cleavage or RNA mapping, and additionally for the study and control of
cgene expression in cells. The oligoarabinonicleotides have excellent
affinity for RNA, increased resistance to nucleases and show little if
can non-specific binding to cellular or serum proteins. They target ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RNA, but not complementary so DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinomucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligoancleotides. Sequences AAZ87165-287169 represent oligodeoxyarabinomucleotides containing 2'-deoxy-2'fluoro-beta-barabinose used in an exemplification of the present invention

The invention relates to a new composition for selective, sequence-
specific inhibition of gene transcription and expression in a host. The
composition comprises oligonuclectides containing arabinose sugars that
can hybridise to either a a single-stranded (ss) RNA to induce RNase H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
oligoarabinonuclectides are used for antisense inhibition of gene
expression or to prevent DNA replication, or reverse transcription. The
by retroviruses. The compositions are therefore particularly used to
inhibit retroviral replication. The oligoarabinonucleotides can also be
used, in combination with RNase H, as reagents for sequence-specific
cleavage or RNA mapping, and additionally for the study and control of
gene expression in cells. The oligoarabinonucleotides have excellent
cf gene expression in cells. The oligoarabinonucleotides have excellent
caffinity for RNA, increased resistance to nucleases and show little if
any non-specific binding to cellular or serum proteins. They target as
RNA, but not complementary as DNA, so may be useful for targetting
cretroviral genomic RNA to inhibit the early stages of viral replication.
Oligoarabinonucleotides containing pyrimidine bases form triple helices
with significantly higher thermal stability than those produced by normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication.
                                                                                                                                                                                       2'-deoxy-2'-fluoro-beta-D-arabinose; antisense; inhibition;

rat secreted factor P00188\_D12 gene

The patent discloses novel secreted factor protein encoded by clone pools 112. The secreted factor is differentially expressed in certain disease states. Secreted protein, its antibodies, antagonists or compositions comprising them are useful in the diagnosis and treatment of cardiac diseases such as congestive heart failure, myocardiis, hypertrophic cardiomyopathy, angina pectoris, myocardiis, and treatisocalerosis, widney diseases such as acute renal cardium, renal infarction, nephrogenic diabetes insipidus, polycystic kidney disease, hereditary nephritis and inflammatory diseases such as asthma, autoimmune diabetes, tumour angiogenesis, rheumatoid arthritis, osteoarthritis, toxic shock syndrome, asthma, stroke, neural trauma, psoriasis, cerebral malaria, osteoporosis, crohn's disease, ulcerative colitis, Alaheimer's disease. Secreted crohn's disease, ulcerative colitis, Alaheimer's disease. Secreted to reference RNA or DNA encoding the secreted factor is useful for detecting cardiac, kidney and inflammatory disease. The present DNA sequence is an oligonucleotide which is used in the preparation of a commalised convalined are used in the identification of differentially expressed convalined are used in the identification of differentially expressed

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                       Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; tungal infection; parasitic infection; cancer; asthma; infections disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 18; DB 1; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an array of proteins (antibody mimics) comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bind to a compound that is not bound by a corresponding naturally-occurring fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is an oligonucleotide A18-2PEG linker used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fibronectin scaffold protein array for obtaining a protein/compound which binds to a compound/protein, comprises a fibronectin type III domain having a randomized loop, a randomized beta-sheet or their combination.

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrinidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bantigens antigens antigens antigens. The method is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the

PUREL 1. It was used in the construction of a normalised rat cDNA library, which was used in an example demonstrating differential expression of a rat gene referred to as clone P00210009. The invention relates to a polypeptide comprising a sequence of at least 80% identity to residues 22-122 of the present sequence, or a sequence encoded by a nucleic acid hybridising under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological activity of the polypeptide encoded by clone P00210009. The polypeptides and polynucleotides of the invention are useful for the treatment of activity creal and inflammatory diseases. The polynucleotides are useful in antisense mediated gene inhibition and in gene therapy. The polypeptides are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac, kidney or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rat; secreted factor polypeptide; cardiac disease; renal disease; kidney; inflammatory disease; congestive heart failure; myocarditis; asthma; ss; dilated congestive cardiomyopathy; angina pectoris; cardiac arrhythmia; myocardial infarction; pulmonary hypertension; arteriosclerosis; stroke; atherosclerosis; cardiac tumour; glomerulonephritis; nephrotic syndrome; renal infarction; hereditary nephritis; polycystic kidney disease; chronic renal failure; renal vain thromboais; medullary sponge kidney; rheumatoid arthritis; ostcoarthritis; psoriasis; restenosis; PCR primer; graft versus host reaction; Crohn's disease; ulcerative colitis; probe; Alzhelmer's disease; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                            present sequence corresponds to polylinker DNA of the phagemid vector
                                                                                                                                                                                                                                                      Novel secreted factor encoded by clone P00210D09 useful for diagnosing, treating and/or preventing various cardiac, renal and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to rat secreted factor polypeptides and the polynucleotides encoding them. The sequences are useful for treating cardiac, renal or inflammatory diseases. These include cardiac diseases such as congestive heart failure, myocarditis, dilated congestive cardiomyopathy, angina pectoris, myocardial infarction, cardiac cardiac tumours, renal diseases such as glomerulonephritis, nephrotic syndrome, renal infarction, hereditary nephritis, polycystic kidney disease, chronic renal failure, renal vein thrombosis and medullary consumptivitis, and infarmatory diseases such as asthma, rheumatoid arthritis, arthritis, stroke, psoriasis, restenosis, graft versus chost reaction, Crohn's disease, ulcerative colitis and Alzheimer's disease. Sequences AAS94693-AAS9475 represent cDNA clones, which encode the secreted factor polypeptides of the invention, and oligonucleotide
                                                                                                                                                                                                                                        Novel secreted factor polypeptide useful for treating cardiac diseases such as arteriosclerosis, myocardial infarction, inflammatory diseases such as asthma, stroke, and rheumatoid arthritis and renal diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18 BP; 0 A; 0 C; 0 G; 18 T; 0 U; 0 Other;

Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.

Claim 2; Page 36; 276pp; English.

administering at least one antiangingenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangingenic nucled acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, obler-Webber Syndrome, myocardial angiogenesis, plaque meovascularisation, telangiectasia, hemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic The invention relates to inhibiting angiogenesis in a subject, acid of the invention

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject container acids acids, and instructions for administering them to a subject thaving a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque convoluarisation, intestinal adhesions, atheroselerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of

Sequences of the invention are useful for the manufacture of cytotoxic agents against apoptosis. resistant calls, where the agents are useful for diagnosis, prevention, treatment of disorders associated with dysfunctions of GAP-SH3 binding protein, factors for generating or detoxifying reactive oxygen species (ROS) and factors for blocking and/or by-passing of caspasses. They are useful for tumour therapy. Cytotoxic proteins of the invention are useful for destroying tumours and/or selectively killing cells in tissues, for identifying novel targets for the development of pharmaceutical agents,
                                                                                                                                                                                                                                     the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          useful for destroying tumors, for identifying novel targets for the development of anti-tumor agents, and as specific ion channel modulators.
                               expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Apoptosis; ion channel modulator; hyperproliferative disease; tumour; therapy; leukaemia; carcinoma; sarcoma; degenerative disease; melanoma; Alzhaimer's disease; parkinson's diseases arteriosclerosis; melanoma; heart disease; stroke; vascular disease; nootropic; neuroprotective; cerebroprotective; cardiant; cytotoxic protein; cyplasin L; ss.
cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expressive cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cerophageal cancer, colon and rectum cancer, connective tissue cancer, nesophageal cancer, ingressive cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, spancreatic cancer, prostate cancer, habdomysaarcoma, skin cancer, stomach cancer, resticular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in texemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polypeptide having cytotoxic activity obtainable from Aplysia, useful for destroying tumors, for identifying novel rarners for the

In the method an RNA molecule is obtained and a first primer is added that comprises a region that hybridises to a complementary region of the molecule before a second primer is added comprising at least one riboguanine at the 3' end of the primer. A first complementary nucleic acid molecule is synthesised, the RNA molecule and second primer are removed and a second complementary nucleic acid molecule is synthesised to form a second hybrid with an extension product of the third primer bound to the first complementary molecule. The method
preferably anti-tumour agents and as specific ion channel modulators, e.g., blockers or openers for therapy, diagnostic or research. They are useful for the diagnosis and therapy of hyperproliferative diseases, preferably tumours, e.g., leuksemia, carcinoma, sarcoma and melanoma. They are also useful for development of drugs for the treatment of degenerative diseases such as Alzheimer's disease, Parkinson's disease, arteriosclerosis, heart diseases, stroke and vascular diseases. The present sequence is an oligonucleotide which is used for amplifying sea hare cyplasin L DNA. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     oĘ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel method for increasing the efficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing efficiency of second strand cDNA synthesis using terminal continuation model before performing further RNA amplification by RNA
                                                                                                                                                                                                                                                                  Gaps

The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises: (a) CDNAs obtained by transcribing respectively from at least two tissue RNAs are respectively from at least two tissue RNAs are respectively fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from added cDNAs are mixed together; (d) and appror primer having the common sequence to said different adaptor and a gene specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from polyadenylic acid of the mRNA before the addition of the adaptor among the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the cDNA amounts are measured between the tissues; (f) the RNA is detected from the measured result; (g) each different adaptor and a common adaptor are added to each of the genomic DNA fragments derived from a same or different individuals; (h) the resultant adaptor-added genomic DNAs are
                                                                                                                                                                                         ô
of the invention is useful for increasing the efficiency of second strand CODA synthesis and may be used for linear amplification of genetic signals from histologically stained tissue. The present sequence represents a poly d(T) PCR primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mixed together; (i) the adaptor-added genomic DNAs are amplified by using an adaptor primer having the common sequence to the different adaptor and a sequence-specific adaptor; and (j) the ratios of the amplified amounts of the genomic DNAs are measured between the individuals. The method is
                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified decoxyribonucleotide. Oligonucleotides of rehe invention are useful for preventing or decreasing translation.

They are useful for selectively preventing on a target RNA in a system. They are useful for selectively preventing gene expression in a sequencement for viral RNA, to hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments particular target RNA. The invention is used in gene therapy. The present sequence is a target RNA, used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                       Novel acyclic linker-containing oligonucleotide useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified decoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel acyclic linker-containing oligonuclectide useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonuclectide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2'F-ANA antisense oligo #1, to elicit RNase H degradation of target RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Acyclic linker; gene expression; gene therapy; ribonuclease; RNase H;
gene expression; gene therapy; ribonuclease; RNase H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclasse) and degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                        decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunostimulatory, antiinflammatory, dermatological, antipsoriatic, antiulcer; gene therapy, vaccine, non-allergic inflammatory disease, psoriasis, eczema, allergic contact dermatitis, latex dermatitis, inflammatory bowel disease, ulcerative colitis, Crohn's disease; ss.

```

```
New oligonucleotide, useful for preventing or treating a disease related to a target RNA in a system, e.g., AIDS or hepatitis B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a new oligonucleoside which comprises alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least to each of the first and second segments, so that it comprises at least 2 each of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a least part inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a target RNA in a system, detecting the presence of a target RNA in a system, detecting the presence of a
                                                                                                                                                            The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sugar-modified nucleoside, acquired immune deficiency syndrome, AIDS; hepatitis B; gene therapy; virucide; anti-HIV; antisense; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                  Treating non-allergic inflammatory diseases, such as psoriasis, ecze allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense oligo #1 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   .,

                                                                                                                                                                                                                                                                                                                                                          Antisense DNA-RNA hybrid #2 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide, useful for preventing or treating a disease related
to a target RNA in a system, e.g., AIDS or hepatitis B.
target RNA in a system or preventing or treating a disease related to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hegatitis B. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new oligonucleoside which comprises alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 cach of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a
                                                                                                                                            Gaps

The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sugar-modified nucleoside; acquired immune deficiency syndrome; AIDS; hepatitis B; gene therapy; virucide; anti-HIV; antisense; DNA-RNA hybrid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense DNA-RNA hybrid #3 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide, useful for preventing or treating a disease related to a target RNA in a system, e.g., AIDS or hepatitis {\tt B}.
replication of a target RNA in a system, detecting the presence of a target RNA in a system, detecting the presence of a target RNA in a system, validating a gene target corresponding to a target RNA in a system, or preventing or treating a disease related to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present

                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                     Sugar-modified nucleoside, acquired immune deficiency syndrome, AIDS, hepatitis B; gene therapy; virucide; anti-HIV; antisense; DNA-RNA hybrid;
replication of a target RNA in a system, detecting the presence of a target RNA in a system, validating a gene target corresponding to a target RNA in a system or preventing or treating a disease related to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present sequence is an antisense DNA-RNA hybrid used in the exemplification of

The present invention relates to a new oligonucleoside which comprises alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least of least one 2-deoxynucleoside. The oligonucleoside comprises at least 2 cach of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNAse H-mediated cleavage of a target RNA in a composition of a target RNA in a system, transcription or target RNA in a system, and spaced corresponding to a target RNA in a system or preventing or treating a disease related to a target RNA in a system, or preventing or treating a disease related to a target RNA in a system, or preventing or treating a disease related to a target RNA in a system, or useful inn gene therapy. The present corresponding to a target RNA in a system, or useful inn gene therapy. The present corresponding to a target RNA in a system, a system or useful in gene therapy. The present corresponding to a target RNA in a system or bepatities an antisense DNA-RNA hybrid used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotide, useful for preventing or treating a disease related to a target RNA in a system, e.g., AIDS or hepatitis B.

                                                                                                                                                                셤
                                                                                                                                        ð
                                                                                           The present invention relates to a new oligonucleoside which comprises alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least cach of the first and second segments, so that it comprises at least 2 of each of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a target RNA in a system, of the target RNA in a system, and the segment of a target RNA in a system, of treating a disease related to a target RNA in a system, of treating a disease related to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present a sequence is a target RNA used in RNase H assay. This sequence is used in
                                                                                                                                                                                                                                                                                                                                                                           ö
                            New oligonucleotide, useful for preventing or treating a disease related to a target RNA in a system, e.g., AIDS or hepatitis B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.

The present invention relates to a method for detecting nucleic acid (NA). The method involves hybridizing the NA with nucleic acid target sequence obtained from reverse transcription or RNA amplification using the sample RNA as a template and single stranded probes immobilized on a support body. The present sequence was used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting nucleic acid, by hybridizing nucleic acid with other nucleic acid target obtained from reverse transcription or RNA amplification, an other single stranded nucleic acid probe immobilized on a support body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid amplification; RNA transcription; RNA polymerase; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for the concurrent interrogation of a number of polymorphic sites in the presence of, and without interference from, non-designated polymorphic sites. Specifically, it comprises conducting a multiplexed elongation assay by applying one or more temperature cycles to achieve linear amplification of the target or a combination of annealing and elongation steps under temperature. Controlled conditions. Furthermore, this detection method uses probe extension or elongation and relies on enzymatic recognition, a superior cechnique that no longar depends on differential hybridisation. The present invention describes probes and methods useful for identifying or detecting polymorphisms at one or more designated sites, such that they can identify mutations within the cystic fibrosis conductance transmembrane regulator (GFTR) or the human leukocyte antigen (HLA) genes. In addition, concurrent interrogation of a multiplicity of genetic profiling, and identity testing. This classified is the negative control probe used for the elongation mediated multiplexed analysis of HLA-DR, in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                     The invention relates to amplifying for RNA in a sample comprises eliminating single-stranded oligonucleotide from the transcription sample. The method involves synthesizing single-stranded cDNA by incubating the sample RNA with reverse transcriptase and an oligonucleotide primer that primes synthesis in a direction toward 5' end of the RNA; converting the single-stranded cDNA into double-stranded cDNA to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription from a polynucleotide template. The method inhibits the undesired nontemplate derived production of RNA in the transcription reaction. Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA
                          Amplifying for RNA in a sample, useful for improving RNA polymerase based RNA transcription from a polynucleotide template, comprises eliminating single-stranded oligonucleotide from the transcription sample.

```
which is bound several test elements, each of the test elements comprising a reaction domain and a detection domain, introducing into the chamber a fluid that is interactive with the reaction domains, removing the fluid from the chamber, determining by means of the detection domains, removing the locations at which the fluid has not interacted with the reaction domains the locations to the functional property of the comprises a member of a specific binding pair. The detection domain comprises a member of a specific binding pair. The detection domain comprises a member of a specific binding pair. The determining of the comprises interacted with the fluid. The functional property is chosen from the flow pattern of the fluid, respect the fluid and time dependent reactivity of the fluid. The method is useful for determining a functional property of a fluid in a chamber and for synthesising arrays of biopolymers e.g., arrays of polymucleotides. The method provides for the characterisation of a new fluid in a known flow call, a known fluid in a new flow call or a new fluid in the method combination. This sequence represents a test element used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of synthesising single stranded cDNA by a 5'-ligated adaptor-mediated process involving: annealing a CDNA synthesis primer to RNA, separating the cDNA strand from the RNA, purifying the cDNA, contacting the cDNA with an adaptor, ligating the adaptor through 5'-phosphate on strand (II) of the adaptor to single stranded using DNA ligase, and amplifying the obtained ligated single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthesizing single stranded cDNA, involves annealing cDNA synthesis primer to RNA and synthesizing first cDNA strand, ligating adaptor to single stranded cDNA using DNA ligase, and amplifying ligated single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       single stranded cDNA; adaptor-mediated process; cDNA synthesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

cc stranded fragment in an molecular amplification procedure. The method is useful for: synthesising a single stranded cDNA by a 5'-ligated adaptor-cc mediated process, where the source of nucleic acid is chosen from blood, serum, plasma, cerebrospinal fluid, urine, tissue samples, biopsies and caliva. The tissue sample comprises a cell population which may be single cell, 100-1000000 cells or more as desired, making a cDNA library from a collection of mRNA molecules in a sample, where the method is applied to amplify the cDNAs corresponding to the mRNAs by annealing one or more convariant of mRNA molecules in a sample, where the method is applied to amplify the cDNAs corresponding to the mRNAs by annealing one or more convariant is modified by by biotin in the 5' end, isolating the biotin-containing single stranded cDNA (sense) by use of streptavidin coated containing single stranded cDNA (sense) by use of streptavidin coated containing single stranded cDNA (sense) by use of streptavidin coated magnetic beads, hybridising the sense to the anti-sense cDNA, where an unhybridised sub-population of the anti-sense cDNA is found, isolating the unhybridised sub-population of the anti-sense cDNA, where an unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population by PCR using primer I and correction from the unhybridised sub-population by PCR using primer I and collection from the unhybridised sub-population of the anti-sense cDNA is primer. The method is an improved method for producing amplified cold class and containing application. The method is an improved method for producing amplified cold class and contains a poly-A-tail used to in the contains of cDNA colds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              production single stranded cDNA.

Thirstrup K, Warthoe P, Pettersson NB; WPI; 2004-326403/30. Synthesizing single stranded cDNA, involves annealing cDNA synthesis primer to RNA and synthesizing first cDNA strand, ligating adaptor to single stranded cDNA using DNA ligase, and amplifying ligated single stranded cDNA fragment.

Example 1; SEQ ID NO 7; 22pp; English.

The Invention describes a menthod of synthesising single stranded cubn by contracting describing the cDNA strand from the RNA, synthesis primer to RNA, separating the CDNA strand from the RNA, puritying the cDNA, sontacting the CDNA with an adaptor, ligating the adaptor through 5'-phosphate on strand (II) of the adaptor to single stranded using DNA ligase, and amplifying the obtained ligated single correspond a single stranded frasedure. The method is consent for synthesising a single stranded cDNA by a 5'-ligated adaptor-mediated process, where the source of mucleic acid is chosen from blood, serum, plasma, cerebrospinal fluid, urine, tissue samples, bioppies and saliva. The tissue sample comprises a cell population which may be single coll; 100-1000000 cells or more as desired; making a cDNA library from a collection of mRNA molecules in a sample, where the method is a spile stranded colls or more several mRNAs by annealing one or more constity the CDNAs corresponding to the mRNAs by annealing one or more constaining single stranded cDNA senses synthesisisng a double-stranded cDNA collection from a first mRNA population by the method, where primer 1 is modified by biotin in the 5' end, isolating the biotin-containing single stranded cDNA (sense) by use of streptavidin coated magnetic beads, synthesising a double-stranded cDNA, collection from a second mRNA population of the anti-sense cDNA, where an unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population of the anti-sense cDNA, collection from the unhybridised sub-population and preselected c invention describes a method of synthesising single stranded cDNA by used to in the production single stranded cDNA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a class of CpG immunostimulatory
oligonuclectides containing a 5'TCG motif or a CG at or the 5' end that
are useful for stimulating an immune response. Oligonuclectides and
compositions of the invention are useful for treating allergy or asthma,
viral and bacterial infections and cancer e.g. biliary tract cancer,
or breast cancer, cervical cancer, choriocarcinoma, colon cancer,
commonstrial cancer, cenner, lymphomas, intraepithelial neoplasms,
liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma,
neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer,
cectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer,
and CNS cancer, connective tissue cancer, oseophageal cancer, eye cancer,
chodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer,
testicular cancer, as well as other carcinomas and sarcomas. The
invention is also useful in gene therapy. The present sequence is a CpG
invention is also useful.

The invention relates to rat receptor tyrosine kinase (KDR) and its corresponding nucleic acid sequence. The nucleic acid molecules of the invention are useful for identifying compounds that modulate wild-type rat KDR activity to evaluate the safety and efficacy of specific inhibitors of KDR in rats. KDR inhibitors are useful for treating cancer, inchammation. The present sequence is a reverse transcription (RT) PCR primer used for cloning rat KDR cytosolic domain. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; signal amplification method; gene expression; reverse transcription; self-assembly reaction; DNA chip.

                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                  expressed gene using reverse transcription reaction and a self-assembly reaction of forming a self assembly of oligonucleotide probes, thus improving detection sensitivity of the expressed gene in a DNA chip. (MI) is useful for signal amplification method (MI) for detecting expressed gene (claimed). (MI) improves detection sensitivity of the expressed gene in a DNA chip (claimed). (MI) does not require use of expressive enzymes and enables detection corresponding to the original RNA length or expression amount because of using neither linear amplification nor PCR. This sequence corresponds to a nucleotide used in the method of the
                                                                                                                                                                          invention relates to a signal amplification method (M1) for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preparing amplified RNA (aRNA) sequences present in single stranded or made single stranded target polynucleotide(8), useful for detecting

The invention comprises a method of preparing amplified RNA (aRNA)

c sequences present in one or more target polynucleotide that is single
stranded or made single stranded. The method involves forming double
c stranded or made single stranded. The method involves forming double
c stranded cDNA templates containing sequences present in the target
c polynucleotide and transcribtion via the promoter region to produce
c amplified RNA containing sequences of the target polynucleotide. The
c method of the invention is useful for amplifying the population of RNAs
c spice variants. The method is also useful for determining gene
c extracted from formalin-fixed tissues and/or the population of RNAA
c splice variants. The method is also useful for determining gene
c extracted from in neuronal and non-neuronal cells involved in disorders of
the nervous system, such as: neurodegenerative diseases (e.g. Parkinson's
c disease, Alzheimer's disease, and multiple sclerosis); psychiatric
c disease, Alzheimer's disease, and multiple sclerosis); psychiatric
c depression, lack of appetite control, and attention deficit disorder).
C depression, lack of appetite control, and attention deficit disorder).
C fromethod of the invention may also be used to detect cancer cells, and
c of acilitate diagnosis/progrosis of cancer in a patient. The present RNA
c sequence is shown in a figure exemplifying the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Preparing amplified RNA (aRNA) sequences present in single stranded or made single stranded target polynucleotide(s), useful for detecting cancer cells, comprises transcribing double stranded cDNA templates with
